The front end application can either use SAML (OIDC is not yet supported) or OpenID Connect. I am finding conflicting information regarding the Azure B2C standalone login. The application cannot support non-IDP login (SAML), so I opted for OIDC. However, since we are also using Azure Active Directory, I wanted to see if the B2C standalone login supported SAML. I have gone through all the [Microsoft docs][1] for SAML, OIDC, beta, and found no information on standalone login. In testing, B2C standalone login works. However, when using the authentication library, the error: The login request was rejected because a sufficient SecurityTokenCredential was not available in the SecurityTokenCache. More information is available by running the sample code. Is appearing. I have double checked and other solutions were suggesting using JWTs. [1]: A: This is a known issue. The issue has been resolved in the latest version of the Beta SDK. Check this link for more details Role of membrane permeability properties on the thermodynamics of slow-scan video-enhanced fluorimetry. The initial velocity of a mobile labeled fluorescence probe is measured by means of a fast track-

recording scan of the excitation beam, which is followed by a slow track-recording scan of the emitted fluorescence. This technique exploits the sensitivity of fluorescence to its environment and is a valuable tool for in situ measurements of both membrane transport and viscosity. Recently, several groups have demonstrated the use of this technology to measure the diffusion-limited flux of a fluorescent probe across lipid membranes, with the results obtained for the permeability properties of the membrane being similar to those obtained by conventional fluorescence stopped-flow methods. However, the thermodynamics 55cdc1ed1c
